**Producers, Consumers, and Partial Equilibrium** provides a systematic and accessible presentation of the full formal details in the core theories of producer and consumer choice under conditions of price taking, and covers the standard theories of competitive, monopoly, and oligopoly partial equilibrium among these economic actors. The book pulls together foundational content from many classic sources and organizes it in a self-contained format that rigidly adheres to optimization as the central behavioral postulate and analytical tool for economic theory. The book maintains a sharp focus on the properties of outcomes from optimizing behavior in varying environments. These properties are the refutable hypotheses from each optimization behavioral postulate, and they form the core content of this positive economic theory. In so doing, the book presents and documents the underlying formal structure of the theory with a higher degree of integration and completeness than is typical of Ph.D. textbooks in microeconomics. Includes comprehensive, focused and unified coverage of the mathematics required for the core theories of producer and consumer choice, and partial equilibrium Presents a generalized envelope theorem as a key source of refutable hypotheses Delineates the role of active versus inactive constraints in generating refutable hypotheses Discusses convex functions in economic optimization environments Presents the full formal details of core producer and consumer and producer theory in a unified and systematic manner Emphasizes the refutable hypotheses resulting from behavioral postulates and the completeness (duality) of those hypotheses for the postulated behavior within microeconomics Includes end-of-chapter exercises, full index, and an instructor's solutions manual Includes a concordance that matches its chapters with those of major textbooks

This book addresses the gaps in undergraduate teaching of partial equilibrium analysis, providing a general equilibrium viewpoint to illustrate the assumptions underlying partial equilibrium welfare analysis. It remains unexplained, at least at the level of general economics teaching, in what sense partial equilibrium analysis is indeed a part of general equilibrium analysis. Partial equilibrium welfare analysis isolates a market for a single commodity from the rest of the economy, presuming that other things remain equal, and measures gains and losses by means of consumer surplus. This is a money metric that is supposed to be summable across individuals, recommending policy that maximizes the social surplus. But what justifies such apparently uni-dimensional practise? Within a general equilibrium framework, the assumption of no income effect is presented as the key condition, and substantive general equilibrium situations in which the condition emerges are presented. The analysis is extended to the case of uncertainty, in which the practice adopts aggregate expected consumer surplus, and scrutinizes when such practice is justified. Finally, the book illustrates partial equilibrium as an institutional artifact, meaning that institutional constraint induces individuals to behave as if they are in partial equilibrium. This volume forms an important contribution to the literature by researching why this disparity persists and the implications for economics education.

**International Trade: Theory, Evidence and Policy** provides an integrated non-mathematical account of trade theory and policy that can be read straight through. The footnotes provide caveats, extensions and entry points, or further reading. This book is divided into three parts. The first part focuses on the core theoretical analysis of international trade that has evolved over a quarter-millennium. The second part reviews recent empirical research in global value chains, trade costs, and heterogeneous firms, particularly from analysing large datasets of individual firms' characteristics and of trade flows disaggregated to very finely detailed levels. The third section of the book analyzes trade policies and discusses current policy debates. This edition is based on Pomfret's Lecture Notes on International Trade Theory and Policy, first published in 2008. The content has been extensively updated and revised to stand as a new volume.

This paper presents a model of the Malawi maize commodity market that is developed for use as a policy analysis tool. The model captures national and local maize market dynamics and the linkages existing within the maize market in the country. This research has been undertaken in order to provide policy makers with a robust tool which can be used to simulate the impact of policy changes on markets and households. Such a tool ensures the availability of evidence for informing food and agricultural policies. The model is a multiequation partial equilibrium model of the national maize market in Malawi. It is developed and linked in a top-down unidirectional manner to the local maize economy via a price linkage equation. A nonbehavioral arithmetic microaccounting approach is used to estimate rural household incomes that are linked to the local economy, through which macroeconomic-level maize price changes transmit. The model can be used as a tool for analyzing the impacts of macroeconomic and agricultural policy changes on the maize industry as well as on rural households that rely on maize. The novelty of the model is that it takes into account the interrelationships between farmhousehold, local-economy, and national maize market prices, as well as economic theory and existing empirical evidence, to build a framework that is capable of linking to the macroeconomy rural subsistence households that are traditionally deemed to have few or no backward and forward linkages.
