This book introduces the geometry of 3-D vision, that is, the reconstruction of 3-D models of objects from a collection of 2-D images. It details the classic theory of two view geometry and shows that a more proper tool for studying the geometry of multiple views is the so-called rank consideration of the multiple view matrix. It also develops practical reconstruction algorithms and discusses possible extensions of the theory.

A basic problem in computer vision is to understand the structure of a real world scene given several images of it. Techniques for solving this problem are taken from projective geometry and photogrammetry. Here, the authors cover the geometric principles and their algebraic representation in terms of camera projection matrices, the fundamental matrix and the trifocal tensor. The theory and methods of computation of these entities are discussed with real examples, as is their use in the reconstruction of scenes from multiple images. The new edition features an extended introduction covering the key ideas in the book (which itself has been updated with additional examples and appendices) and significant new results which have appeared since the first edition. Comprehensive background material is provided, so readers familiar with linear algebra and basic numerical methods can understand the projective geometry and estimation algorithms presented, and implement the algorithms directly from the book.

This book studies the funding problems with shareholder litigation through a functionally comparative way. In fact, funding problems with shareholder lawsuits may largely discourage potential shareholder litigants who bear high financial risk in pursuing such a claim, but on the other hand they may not have much to gain. Considering the lack of incentives for potential shareholder claimants, effective funding techniques should be in place to make shareholder actions function as a corporate governance tool and discipline corporate management. The book analyzes, among others, the practice of funding shareholder litigation in the Australia, Canada, the UK, the US and Israel, and covers all of the typical approaches being used in financing shareholder litigation in the current world. For instance, Israel and Canada (Quebec and Ontario) are probably unique in having a public funding mechanism for derivative actions and class actions, while Australia is the country where third party litigation funding is originated and is growing rapidly. Based on this comparative research, the last part of this book discusses how to fund shareholder litigation in China in context of its social and legal background and what kind of problems need to be solved if certain funding techniques are used.

Category theory is unmatched in its ability to organize and layer abstractions and to find commonalities between structures of all sorts. No longer the exclusive preserve of pure mathematicians, it is now proving itself to be a powerful tool in science, informatics, and industry. By facilitating communication between communities and building rigorous bridges between disparate worlds, applied category theory has the potential to be a major organizing force. This book offers a self-contained tour of applied category theory. Each chapter follows a single thread motivated by a real-world application and discussed with category-theoretic tools. We see data migration as an adjoint functor, electrical circuits in terms of monoidal categories and operads, and collaborative design via enriched profunctors. All the relevant category theory, from simple to sophisticated, is introduced in an accessible way with many examples and exercises, making this an ideal guide even for those without experience of university-level mathematics.

Based largely on official Soviet archive material, this study describes and analyses all aspects of Islam which relate to the Soviet domestic scene, with the purpose of demonstrating how it survived in the face of Soviet repression and secularisation.

Continuing a Gold Medallion Award-winning legacy, this completely revised edition of The Expositor's Bible Commentary series puts world-class biblical scholarship in your hands. Based on the original twelve-volume set that has become a staple in college and seminary libraries and pastors' studies worldwide, this new thirteen-volume edition marshals the most current evangelical scholarship and resources. The thoroughly revised features consist of: • Comprehensive introductions • Short and precise bibliographies • Detailed outlines • Insightful expositions of passages and verses • Overviews of sections of Scripture to illuminate the big picture • Occasional reflections to give more detail on important issues • Notes on textual questions and special problems, placed close to the texts in question • Transliterations and translations of Hebrew and Greek words, enabling readers to understand even the more technical notes • A balanced and respectful approach toward marked differences of opinion
