In AWWA M11 the load is calculated as the prism of earth above the pipe. This is the maximum dead load the pipe should see over time. Because steel pipe is designed for maximum possible soil load directly over the outside of the diameter of the pipe when the prism load W is used, $D I$ is 1.0. The prism load is a conservative design approach, as the actual earth load on a flexible pipe lies somewhere between the Marston/Spangler trench load and the more conservative prism load.

If non-self-restrained joints exist in the length of pipe affected by the forces of the resultant thrust, then joints can pull apart. Mechanical couplings are the most prominent example of this condition on steel pipe. Bolted harnesses have been included for many years in AWWA M11 starting with the 1st edition in 1964. The first harnesses were simple U-shaped lugs (See Figure 1) with bolts designed to resist the thrust.

Buried pipes are a highly efficient method of transport. In fact, only open channels are less costly to construct. However, the structural mechanics of buried pipes can be complicated, and imprecisions in the properties of the soil envelope are usually too great to justify lengthy, complicated analyses. Designers and engineers need principles and m
