If this change in 6-80 value as a function of changing sea level were entirely an ice-volume effect, it would require that glacial meltwater be returned to a well-mixed ocean with an isotopic composition on the order of -95 per mil This is a seemingly outrageously negative number; glaciers today range from -20 to -50 per mil To escape this dilemma, we might also pursue the possibility that (1) there is systematic offset in the two age models; (2) the shape of the geoid has changed, thus ...
