The fixed effects model is used to analyse the relationship between the explained variable (profitability) and the explanatory variables (leverage) across firms. It caters for individual characteristics of each entity; how the capital structure of a firm may or may not affect its profitability.

A major element in utility regulation is the setting of just and reasonable allowed rates of return. This rate is a weighted average of the costs of the types of capital employed by the firm, and the weights should reflect the firm's target capital structure. The information required to set the target, or optimal, capital structure includes the relationships between the component costs of capital and the amount of financial leverage used. The primary objective of this study is to empirically estimate the relationships between financial leverage and the costs of common equity and debt for electric utilities. Two different approaches were used to estimate these relationships. First, an econometric model was developed with the component cost as the dependent variable and leverage as the independent variable. Other factors were included as independent variables to account for nonconstant business risk. Second, a model was developed using the bond rating guidelines and bond yields reported by Standard & Poor's Corporation. The data set consisted of about 70 electric utilities for 1983 and 1984. The results indicated a strong positive relationship between financial leverage and the costs of debt and equity. Several leverage measures were used, and the relationship was strongest when leverage was measured by market value debt-to-equity ratios. The relationships were stronger than reported in previous studies, and there was no indication that the relationships were nonlinear when leverage was measured by debt-to-equity ratios. Further, the two most important business risk factors to both debt and equity investors were nuclear construction programs and reserve margins. Somewhat surprisingly, regulatory climate did not affect debt or equity costs.

Judging by the sheer number of papers reviewed in this Handbook, the empirical analysis of firms' financing and investment decisions—empirical corporate finance—has become a dominant field in financial economics. The growing interest in everything "corporate is fueled by a healthy combination of fundamental theoretical developments and recent widespread access to large transactional data bases. A less scientific—but nevertheless important—source of inspiration is a growing awareness of the important social implications of corporate behavior and governance. This Handbook takes stock of the main empirical findings to date across an unprecedented spectrum of corporate finance issues, ranging from econometric methodology, to raising capital and capital structure choice, and to managerial incentives and corporate investment behavior. The surveys are written by leading empirical researchers that remain active in their respective areas of interest. With few exceptions, the writing style makes the chapters accessible to industry practitioners. For doctoral students and seasoned academics, the surveys offer dense roadmaps into the empirical research landscape and provide suggestions for future work. *The Handbooks in Finance series offers a broad group of outstanding volumes in various areas of finance *Each individual volume in the series should present an accurate self-contained survey of a sub-field of finance *The series is international in scope with contributions from field leaders the world over

The research reported in this volume represents the second stage of a wide-ranging National Bureau of Economic Research effort to investigate "The Changing Role of Debt and Equity in Financing U.S. Capital Formation." The first group of studies sponsored under this project, which have been published individually and summarized in a 1982 volume bearing the same title (Friedman 1982), addressed several key issues relevant to corporate sector behavior along with such other aspects of the evolving financial underpinnings of U.S. capital formation as household saving incentives, international capital flows, and government debt management. In the project's second series of studies, presented at the National Bureau of Economic Research conference in January 1983 and published here for the first time along with commentaries from that conference, the central focus is the financial side of capital formation undertaken by the U.S. corporate business sector. At the same time, because corporations' securities must be held, a parallel focus is on the behavior of the markets that price these claims.
